

3D ellipsoid shape parameters

ellipticity triaxiality size

$$\vec{\theta} \equiv (E, T, \log A) \sim \mathcal{N}_3(\vec{\mu}, \Sigma)$$

$\vec{\theta}$ assumed to be distributed as 3D Gaussian with unknown mean $\vec{\mu}$ and covariance matrix Σ

where

$$\vec{\mu} = (\mu_E, \mu_T, \mu_{\log A}) \quad \Sigma = \begin{bmatrix} \sigma_E^2 & 0 & \rho\sigma_E\sigma_{\log A} \\ 0 & \sigma_T^2 & 0 \\ \rho\sigma_E\sigma_{\log A} & 0 & \sigma_{\log A}^2 \end{bmatrix}$$

Hamiltonian Monte Carlo

Observed uncertainties in b/a and $\log(a)$ are taken into account when creating the library of banana diagrams

Poisson likelihood of each bin of the 2D histogram is assumed to be independent for simplicity
